Delta-Rules

A set of rules δ of the form $c\,t_1 \ldots t_n \;\rightarrow\; r$
with $c \in \mathcal{C},\;\; t_1, \ldots, t_n,\;\; r \in \Lambda$ is a *set of Delta-rules* iff

- $t_1, \ldots, t_n, r$ are closed lambda-terms
- all t_i are in $\rightarrow_\beta$-normal form and
  they do not contain the left-hand side of a rule from δ
- δ does not contain different rules $c\,t_1 \ldots t_n \;\rightarrow\; r,\;\; c\,t_1 \ldots t_m \;\rightarrow\; r'$
  with $m \geq n$

δ-Reduction

- $l \;\rightarrow_\delta\; r$, if $l \rightarrow r \;\; \in \delta$
- $t_1 \;\rightarrow_\delta\; t_2$ implies $(t_1\, r) \;\rightarrow_\delta\; (t_2\, r)$, $(r\, t_1) \;\rightarrow_\delta\; (r\, t_2)$, $\lambda y.t_1 \;\rightarrow_\delta\; \lambda y.t_2$

We define $\rightarrow_{\beta\delta} = \rightarrow_\beta \cup \rightarrow_\delta$.

Non-Terminating Reductions

- Even β-reduction does not terminate:

$$(\lambda x.x\,x)\,(\lambda x.x\,x) \to_\beta (\lambda x.x\,x)\,(\lambda x.x\,x) \to_\beta \ldots$$

- In general, termination depends on the reduction strategy.
  - Leftmost outermost reduction:

$$(\lambda x.y)((\lambda x.x\,x)\,(\lambda x.x\,x)) \to_\beta y,$$

  - Leftmost innermost reduction:

$$(\lambda x.y)((\lambda x.x\,x)\,(\lambda x.x\,x)) \to_\beta (\lambda x.y)((\lambda x.x\,x)\,(\lambda x.x\,x)) \to_\beta \ldots$$

Translation of Simple HASKELL into Lambda Terms

$\mathcal{C}_0$ = pre-defined function symbols (`+`, `not`, `sqrt`, etc.)

Con = constructor symbols (including the ones for `Int`, `Float`, `Char`)

$\mathcal{C} = \mathcal{C}_0 \cup \mathsf{Con} \cup \{\mathtt{tuple}_n \mid n \in \{0, 2, 3, \ldots\}\} \cup \{\mathtt{if}, \mathtt{fix}\}$

$$
\begin{array}{lcl}
\mathcal{L}am(\underline{\mathsf{var}}) & = & \underline{\mathsf{var}} \\
\mathcal{L}am(c) & = & c, \quad \text{where } c \in \mathcal{C}_0 \cup \mathsf{Con} \\
\mathcal{L}am((\underline{\mathsf{exp}}_1, \ldots, \underline{\mathsf{exp}}_n)) & = & \mathtt{tuple}_n\, \mathcal{L}am(\underline{\mathsf{exp}}_1) \ldots \mathcal{L}am(\underline{\mathsf{exp}}_n), \\
 & & \qquad \text{where } n \in \{0, 2, 3, \ldots\} \\
\mathcal{L}am((\underline{\mathsf{exp}})) & = & \mathcal{L}am(\underline{\mathsf{exp}}) \\
\mathcal{L}am((\underline{\mathsf{exp}}_1\ \underline{\mathsf{exp}}_2)) & = & (\mathcal{L}am(\underline{\mathsf{exp}}_1)\ \mathcal{L}am(\underline{\mathsf{exp}}_2)) \\
\mathcal{L}am(\mathtt{if}\ \underline{\mathsf{exp}}_1\ \mathtt{then}\ \underline{\mathsf{exp}}_2\ \mathtt{else}\ \underline{\mathsf{exp}}_3) & = & \mathtt{if}\ \mathcal{L}am(\underline{\mathsf{exp}}_1)\ \mathcal{L}am(\underline{\mathsf{exp}}_2)\ \mathcal{L}am(\underline{\mathsf{exp}}_3) \\
\mathcal{L}am(\mathtt{let}\ \underline{\mathsf{var}} = \underline{\mathsf{exp}}\ \mathtt{in}\ \underline{\mathsf{exp}'}) & = & \mathcal{L}am(\underline{\mathsf{exp}'})\ [\underline{\mathsf{var}} \,/\, (\mathtt{fix}\ (\lambda \underline{\mathsf{var}}. \mathcal{L}am(\underline{\mathsf{exp}})))] \\
\mathcal{L}am(\backslash \underline{\mathsf{var}}\ \mathtt{->}\ \underline{\mathsf{exp}}) & = & \lambda \underline{\mathsf{var}}. \mathcal{L}am(\underline{\mathsf{exp}})
\end{array}
$$

δ-Rules for HASKELL-Programs

Con_n = constructor symbols of arity n

δ_0 = rules for pre-defined symbols in HASKELL
