Interpretation $I = (\mathcal{A}, \alpha, \beta)$

- \mathcal{A} is the *carrier* with $\mathcal{A} \neq \varnothing$
- $\bullet \ \alpha$ is the meaning of function and predicate symbols

$$-\alpha_f: \mathcal{A}^n \to \mathcal{A} \text{ for all } f \in \Sigma_n$$
$$-\alpha_p \subseteq \mathcal{A}^n \text{ for all } f \in \Delta_n$$

• β is the *variable assignment* with $\beta : \mathcal{V} \to \mathcal{A}$

Interpretation of terms $I : \mathcal{T}(\Sigma, \mathcal{V}) \to \mathcal{A}$

$$I(X) = \beta(X) \text{ for } X \in \mathcal{V}$$

$$I(f(t_1, \dots, t_n)) = \alpha_f(I(t_1), \dots, I(t_n)) \text{ for } f \in \Sigma_n \text{ and } t_1, \dots, t_n \in \mathcal{T}(\Sigma, \mathcal{V})$$
