Notes:
- Please solve these exercises in \textit{groups of two or three}!
- The solutions must be handed in \textit{directly before (very latest: at the beginning of)} the exercise course on 11.05.2015, in lecture hall AH 3. Alternatively you can drop your solutions into a box which is located right next to Prof. Giesl's office (this box is emptied \textit{a few minutes before} the exercise course starts).
- Please write the \textit{names} and \textit{immatrikulation numbers} of all students on your solution. Also please staple the individual sheets!

Exercise 1 (Conjunctive Normal Form): \hfill (2 points)

Consider the following formula $\varphi$ with $p_1, p_2, p_3 \in \Delta_0$:

$$\varphi = \neg(\neg p_1 \land (p_2 \rightarrow p_3)) \lor (p_3 \rightarrow p_1)$$

Use the algorithm presented in the proof of Theorem 3.3.2 to convert $\varphi$ to an equivalent formula in \textit{conjunctive normal form (CNF)}.

Exercise 2 (Difference-Resolution): \hfill (1 + 1 = 2 points)

In this exercise we consider a variant of resolution in propositional logic, which we call \textit{difference-resolution}. Let $K_1 = \{L_1, \ldots, L_n\}$ and $K_2 = \{L'_1, \ldots, L'_m\}$ be clauses without variables. Then a clause $R$ is a \textit{difference-resolvent} of $K_1$ and $K_2$ if there are literals $L_i \in K_1, L'_j \in K_2$ such that $L'_j = L_i$, $m = n + 1$, $R = (K_1 \cup K_2) \setminus \{L_i, L'_j\}$. The following diagram illustrates a difference-resolution step:

\begin{align*}
K_1 &= \{L_1, \ldots, L_n\} \\
K_2 &= \{L'_1, \ldots, L'_{n+1}\} \\
(\{L_i, L'_j\} &\subseteq (K_1 \cup K_2) \setminus \{L_i, L'_j\})
\end{align*}

Please prove or disprove the following statements:

\textbf{a)} Difference-resolution is \textit{sound}, i.e., there is no satisfiable clause set $\mathcal{K}$ without variables from which one can derive $\square$ by difference-resolution.

\textbf{b)} Difference-resolution is \textit{complete}, i.e., from any unsatisfiable clause set $\mathcal{K}$ without variables one can derive $\square$ by difference-resolution.

Exercise 3 (Resolution for Propositional Logic): \hfill (3 points)

Consider the following clause set $\mathcal{K}$ with $p_1, \ldots, p_4 \in \Delta_0$:

$$\mathcal{K} = \{\{p_1, p_1\}, \{p_1, \neg p_2, \neg p_3\}, \{p_2, p_4\}, \{p_1, \neg p_1\}, \{\neg p_1\}\}$$

Please show that $\mathcal{K}$ is unsatisfiable by using resolution for propositional logic (cf. Definition 3.3.4 and Example 3.3.5).

\textit{Hint:} It suffices to perform four resolution steps.
Exercise 4 (Unification):  

(2 + 2 + 2 = 6 points)

Consider the signature \((\Sigma, \Delta)\) with \(\Sigma_0 = \{a, b\}, \Sigma_1 = \{f, g\}\) and \(\Delta_3 = \{p\}\). Use the algorithm from the lecture to decide whether the following clauses are unifiable. To document your application of the algorithm on some clause \(K\), please write down the current substituted clause \(\sigma(K)\) whenever the algorithm checks whether \(|\sigma(K)| = 1\) and underline the position of the next symbols where the literals are not equal. Additionally, write down the resulting most general unifier (mgu) or the kind of failure (clash or occur) the algorithm returns.

a) \{p(X, f(X), g(a)), p(Y, f(g(Y)), Y)\}

b) \{p(f(f(X)), W, X), p(Y, f(Y), a)\}

c) \{p(X, g(g(a)), Y), p(g(Y), X, g(b))\}

Hint: To illustrate this exercise, we give a short example for the clause \(\{p(X, Y, Z), p(Z, a, b)\}\):

1. \(\{p(X, Y, Z), p(Z, a, b)\}\)
2. \(\{p(Z, Y, Z), p(Z, a, b)\}\)
3. \(\{p(Z, a, Z), p(Z, a, b)\}\)
4. \(\{p(b, a, b)\}\)
5. mgu: \(\{X/b, Y/a, Z/b\}\)
