

1. Introduction

Dienstag, 20. Oktober 2015 08:30

Term Rewrite Systems (Terminersetzungs-systeme)

Applications

- Specification of Programs
(specify and execute algebraic specifications)
- program analysis + verification
- execution of programs
(term rewriting is already a full prog. language, is the basis of functional programming)
- symbolic computation

Ex: Addition of natural numbers

Express natural numbers by terms over \emptyset and succ

($\emptyset \hat{=} 0$, $\text{succ}(\emptyset) \hat{=} 1$, $\text{succ}(\text{succ}(\emptyset)) \hat{=} 2, \dots$)

Addition algorithm:

$$\text{plus}(\emptyset, y) \equiv y$$

$$\text{plus}(\text{succ}(x), y) \equiv \text{succ}(\text{plus}(x, y))$$

(Functional program, looks like Haskell)

Execution of such a program:

— apply equations from left to right =
term rewriting

Compute "2+1":

$$\text{plus}(\text{succ}(\text{succ}(\emptyset)), \text{succ}(\emptyset)) \rightarrow$$

$$\text{succ}(\text{plus}(\text{succ}(\emptyset), \text{succ}(\emptyset))) \rightarrow$$

$$\text{succ}(\text{succ}(\text{plus}(\emptyset, \text{succ}(\emptyset)))) \rightarrow$$

$$\text{succ}(\text{succ}(\text{succ}(\emptyset)))$$

Topics of the lecture:

- Is the result of a program deterministic?
(Confluence)

$$\text{plus}(\emptyset, \text{plus}(\text{succ}(\emptyset), \emptyset))$$

$$\swarrow$$
$$\text{plus}(\text{succ}(\emptyset), \emptyset)$$

$$\searrow$$
$$\text{plus}(\emptyset, \text{succ}(\text{plus}(\emptyset, \emptyset)))$$
$$\swarrow$$

This example is confluent. How can one check confluence/determinism of programs automatically?

- Does the program always stop after finitely many steps? (Termination)

Our plus-example is terminating.

But one could add:

$$\text{plus}(x, y) \equiv \text{plus}(y, x)$$

Now the prog. is no longer terminating:

$$\text{plus}(0, \text{succ}(0)) \rightarrow \text{plus}(\text{succ}(0), 0) \rightarrow \text{plus}(0, \text{succ}(0)) \rightarrow \dots$$

How can one check termination automatically?

- Does a program satisfy its specification? (Correctness)

plus-program could satisfy properties like:

$$\text{plus}(\text{succ}(\text{succ}(0)), x) \equiv \text{plus}(\text{succ}(0), \text{succ}(x))$$

$$\text{plus}(\text{plus}(x, y), z) \equiv \text{plus}(x, \text{plus}(y, z))$$

Do these properties hold for the plus-program, i.e., do they follow from the 2 plus-equations?

A related question are properties of abstract data types.

Ex: Data types of groups

1 1 0 1 0 1 - 0 0 0

associativity: $f(x, f(y, z)) \equiv f(f(x, y), z)$

neutral element: $f(x, e) \equiv x$

inverse fct. i : $f(x, i(x)) \equiv e$

Does every group satisfy

$$i(i(u)) \equiv u \quad ?$$

i.e.: Does this equation follow from the 3 group axioms? (Yes)

How can one find this out automatically?

• How can one make an "incomplete" program complete? (Completion)

If a program or a data type are incompletely specified, how can one extend them in a suitable way?

Structure of the lecture :

1. Introduction

2. Preliminaries (Syntax + Semantics of terms and equations)

3. Term Rewriting and Deduction of Equations

4. Termination of Term Rewriting

5. Confluence — n —————

6. Completion — n —————

Organisation

- Lecture in English
- German Course Notes (on the web)
- English Notes from the lecture available on the web
- Very old video of parts of the lecture (on the web)
- Web site: <http://verify.rwth-aachen.de/>
Les 15
- Lecture on TUE + THU
Ex. Course on FRI (Florian Frohn)
This week: 3 lectures (lecture instead of ex. course on FRI)
- Lecture for Master (Informatik, SSE, Math)
and Bachelor (Informatik)
 - ↑
 - Wahlpflicht Theorie or
 - Vorgezogene MasterprüfungBachelor: register for exam at EPA,

t. - 17. 12. 15

• Exercises

- weekly exercise sheets
- solve in groups of 2
- submit at beginning of ex. course or in box (E1, 2nd floor)
- 50% of points needed to participate in the exam
- date of exam (written): Feb 22, 2016
2nd exam : March 18, 2016
- to participate in exercises:
please register via our website

(≠ registering for exam
≠ L2P)

until Friday, Oct. 23
