

Functions Operating on the IO Monad

`putChar :: Char -> IO ()`

`getChar :: IO Char`

`(>>) :: IO a -> IO b -> IO b`

`return :: a -> IO a`

`(>>=) :: IO a -> (a -> IO b) -> IO b`

`getChar >> return ()`

reads a character and ignores it

`getChar >>= putChar`

reads a character and prints it on the screen

do-Notation

```
gets :: Int -> IO String
gets 0      = return []
gets (n+1) = getChar >>= \x  ->
                    gets n  >>= \xs ->
                    return (x:xs)
```

```
p >>= \x ->
    q >>= \y ->
        r
```

can be written as

```
do x <- p
   y <- q
   r
```

```
gets :: Int -> IO String
gets 0      = return []
gets (n+1) = do x  <- getChar
                xs <- gets n
                return (x:xs)
```

Simple Evaluation Without Monads

```
data Value a = Result a
```

```
instance Show a => Show (Value a) where  
    show (Result x) = "Result: " ++ show x
```

```
eval1 :: Term -> Value Float  
eval1 (Con x)    = Result x  
eval1 (Div t u) = Result (x/y)  
                where Result x = eval1 t  
                      Result y = eval1 u
```

Evaluation and Exceptions Without Monads

```
data Maybe a = Nothing | Just a
```

```
instance Show a => Show (Maybe a) where
    show Nothing    = "Nothing"
    show (Just x)   = "Just " ++ show x
```

```
eval2 :: Term -> Maybe Float
```

```
eval2 (Con x)    = Just x
```

```
eval2 (Div t u) = case eval2 t of
```

```
    Nothing -> Nothing
```

```
    Just x   -> case eval2 u of
```

```
        Nothing -> Nothing
```

```
        Just y   -> if y == 0
```

```
            then Nothing
```

```
            else Just (x/y)
```

Evaluation and Counting Without Monads

```
data ST a = MakeST (Int -> (a, Int))
```

```
apply :: ST a -> Int -> (a, Int)
```

```
apply (MakeST f) s = f s
```

```
instance Show a => Show (ST a) where
```

```
  show tr = "Result: " ++ show x ++ ", State: " ++ show s  
           where (x, s) = apply tr 0
```

```
eval3 :: Term -> ST Float
```

```
eval3 (Con x) = MakeST (\s -> (x, s))
```

```
eval3 (Div t u) = MakeST (\s -> let (x, s') = apply (eval3 t) s  
                                   (y, s'') = apply (eval3 u) s'  
                                   in (x/y, s''+1))
```

Simple Evaluation With Monads

```
data Value a = Result a
```

```
instance Show a => Show (Value a) where  
    show (Result x) = "Result: " ++ show x
```

```
instance Monad Value where  
    return          = Result  
    Result x >>= q = q x
```

```
eval1 :: Term -> Value Float  
eval1 (Con x)    = return x  
eval1 (Div t u) = do x <- eval1 t  
                    y <- eval1 u  
                    return (x/y)
```

Evaluation and Exceptions With Monads

```
data Maybe a = Nothing | Just a
```

```
instance Show a => Show (Maybe a) where  
    show Nothing    = "Nothing"  
    show (Just x)  = "Just " ++ show x
```

```
instance Monad Maybe where  
    return          = Just  
    Nothing >>= q  = Nothing  
    Just x  >>= q  = q x
```

```
eval2 :: Term -> Maybe Float  
eval2 (Con x)    = return x  
eval2 (Div t u) = do x <- eval2 t  
                    y <- eval2 u  
                    if y /= 0 then return (x/y) else Nothing
```

Evaluation and Counting With Monads

```
data ST a = MakeST (Int -> (a, Int))    apply :: ST a -> Int -> (a, Int)
                                          apply (MakeST f) s = f s
```

```
instance Show a => Show (ST a) where
  show tr = "Result: " ++ show x ++ ", State: " ++ show s
           where (x, s) = apply tr 0
```

```
instance Monad ST where
  return x = MakeST (\s -> (x, s))
  tr >>= q = MakeST (\s -> let (x, s') = apply tr s
                              in apply (q x) s')
```

```
eval3 :: Term -> ST Float
eval3 (Con x)    = return x
eval3 (Div t u) = do x <- eval3 t
                    y <- eval3 u
                    increase
                    return (x/y)
increase :: ST ()
increase = MakeST (\s -> ((), s+1))
```
