

μ -recursive Functions

1. $\text{null}_n(k_1, \dots, k_n) = 0$
2. $\text{succ}(k) = k + 1$
3. $\text{proj}_{n,i}(k_1, \dots, k_n) = k_i$
4. $g(k_1, \dots, k_n) = f(f_1(k_1, \dots, k_n), \dots, f_m(k_1, \dots, k_n))$
5.
$$\begin{aligned} h(k_1, \dots, k_n, 0) &= f(k_1, \dots, k_n) \\ h(k_1, \dots, k_n, k + 1) &= g(k_1, \dots, k_n, k, h(k_1, \dots, k_n, k)) \end{aligned}$$
6. $g(k_1, \dots, k_n) = k \quad \text{iff} \quad \begin{aligned} &f(k_1, \dots, k_n, k) = 0 \text{ and} \\ &\text{for all } 0 \leq k' < k, \\ &f(k_1, \dots, k_n, k') \text{ is defined and} \\ &f(k_1, \dots, k_n, k') > 0 \end{aligned}$

Example plus

$$\begin{aligned} f(x, y, z) &= \text{succ}(\text{proj}_{3,3}(x, y, z)) \\ \text{plus}(x, 0) &= \text{proj}_{1,1}(x) \\ \text{plus}(x, y + 1) &= f(x, y, \text{plus}(x, y)) \end{aligned}$$

Example div

$\text{div}(x, y) = z$ iff $i(x, y, z) = 0$ and
for all $0 \leq z' < z$, $i(x, y, z')$ is defined
and $i(x, y, z') > 0$

Here, $i(x, y, z) = x - y \cdot z$, i.e.,

$$\begin{aligned} i(x, y, z) &= \text{minus}(\text{proj}_{3,1}(x, y, z), j(x, y, z)) \\ j(x, y, z) &= \text{times}(\text{proj}_{3,2}(x, y, z), \text{proj}_{3,3}(x, y, z)) \end{aligned}$$
